

## Case Study: **Warrington College**

### Brief Description

Quest were contacted by a main contractor and asked to tender for works on a new build public-sector project within a college facility for the installation of a resin flooring based system.

### Overview

Quest were specified to apply the Altro high build floor system using Altroproof Solo Universal and Altrotect as the best flooring system for the environment.

The 3-part resin system (one part DPM primer and two parts resin coating) application of Altroproof Solo Universal and Altrotect Plus top coat systems were required to provide a hard wearing, easy to clean and long lasting surface that would be durable enough to meet the needs of the environment.

Quest began by mechanically preparing the concrete substrate using a remote controlled, HTC Duratig grinder, connected to an HTC vacuum, allowing a clean, dust-free operation. The high build system comprised of one coat of Altro Solo DPM (damp-proof membrane) followed by 2 coats of Altrotect Plus which has excellent abrasion resistance and an anti slip scatter added to it for safety purposes.

Quest finished the entire project in just 4 days; with all materials for the 800m<sup>2</sup> floor delivered at once from a single production to ensure no shade variations in the surface.

As experts in their field Quest have worked on many similar projects and the main contractor was very happy with the results of the final installation, quick delivery and overall service received from Quest.
